DETAILED ACTION

1. **Claims 1, 2, 3, and 5** are allowed.

REASONS FOR ALLOWANCE

2. The following is an examiner's statement of reasons for allowance:

Regarding claims 1, 2, 3, and 5, the instant application teaches and the prior art do not teach a sound-reproducing transducer connected to a printed circuit, the transducer having the shape of a hollow cylinder whose cylindrical wall delimits two circular faces, a front face and a rear face that are opposed and planar, the transducer comprising: at least one diaphragm for converting electrical signals into sound waves and vice-versa, the diaphragm being a circular membrane parallel to the front and rear face of the transducer, the diaphragm delimiting two distinct volumes in the transducer; the first volume, bordered on one side by the circular face of the transducer and on the other side by the diaphragm, this first volume forming a front acoustic cavity, and the second volume, bordered on one side by the circular face of the transducer and on the other side by the diaphragm, this second volume forming a rear acoustic cavity, wherein said cylindrical wall of the transducer includes at least one perforation, wherein said perforation is of substantially rectangular shape.

US Patent No. 6,385,328 (Yoo et al.) teaches an electro-acoustic transducer that functions as a buzzer, a receiver, and a micro-speaker for a portable electronic device wherein the transducer is connected to a magnetic circuit and has a top face and a bottom face that are parallel. In addition, the transducer comprises a circular vibration plate that is parallel to the faces of the transducer for converting electrical signals into sound waves. Yoo teaches that a diaphragm separates the transducer into two distinct cavities and a plurality of vent holes disposed in the bottom of the frame of the transducer to perform smooth vibrations of the diaphragm. In this case, Yoo is not obvious over the instant invention because Yoo does not expressly teach a perforation or hole on the cylindrical wall of the transducer, nor does Yoo teach a perforation that is rectangular.

US Patent Application Publication No. 2002/0101333 (Lu) teaches a siren wherein air vents on the sidewall draw in air and sound is generated by the impact between air and each block in the acoustic actuator. In this case, Lu is not obvious over the instant invention because Lu does not teach a rectangular perforation or hole in the cylindrical wall of the transducer.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
